The CKMfitter Group

## Abstract

This document provides the collection of up-to-date inputs to the global CKM analysis, and numerical results obtained with the use of the fit package CKMfitter. The statistical method employed is the frequentist approach *Rfit*. Detailed background information on the methodology and the treatment of experimental and theoretical uncertainties is provided in:

CP VIOLATION AND THE CKM MATRIX:  
ASSESSING THE IMPACT OF THE ASYMMETRIC  $B$  FACTORIES  
By CKMfitter Group  
Eur. Phys. J. **C41**, 1-131, 2005 [hep-ph/0406184]

- [3] The Heavy Flavor Averaging Group (HFAG),  
Winter 2007 averages, <http://www.slac.stanford.edu/xorg/hfag/>
- [4] For the inclusive average we are taking the BLNP number. (The DGE result is very close to the BLNP result. The uncertainty of the DGE calculation does not include all sources evaluated by BLNP.) The theoretical error on the inclusive average is obtained by adding linearly the contributions from weak annihilation, subleading shape functions and the HQE uncertainty on  $m_b$ .  
We use only branching fractions measured for  $B \rightarrow \pi\ell\nu$ . we average the results obtained from the two unquenched Lattice calculations and the LCSR calculation for the form factor quoted by HFAG [3] in such a way that the smallest theoretical error is kept.  
Also for the average between the inclusive and exclusive result we keep the smallest theoretical error.

Table 1: *Inputs to the standard CKM fit.* If not stated otherwise: for two errors given, the first is statistical and accountable systematic and the second stands for systematic theoretical uncertainties. The last two columns indicateRfit treatment of the input parameters: measurements or parameters that have statistical errors (we include here experimental systematics) are marked in the “GS” column by an asterisk; measurements or parameters that have systematic theoretical errors are marked in the “TH” column by an asterisk. Upper part: experimental determinations of the CKM matrix elements. Middle upper part: CP-violation and mixing observables. Middle lower part: parameters used in SM predictions that are obtained from experiment. Lower part: parameters of the SM predictions obtained from theory.
